Data engineer with 3+ years' experience building and maintaining enterprise-scale data pipelines, dashboards, and automation tools at Bank of America. Skilled in Python ETL, SQL, DBT, AWS, and CI/CD DevOps practices, with experience turning business requirements into practical, scalable data solutions.

Key Skills & Technologies

Languages:	Python, SQL, HTML, JavaScript/TypeScript
Frameworks & Libraries:	Django, FastAPI, Pandas, Pydantic, React, TailwindCSS
Data Engineering & ETL:	Kafka, AutoSys, ETL, DBT core, Airflow
Databases & Storage:	MS SQL Server, PostgreSQL, AWS S3
Cloud & Infrastructure:	AWS (ECS Fargate/EC2, Terraform, S3, Glue, Athena), Linux Administration, Apache httpd, Prometheus, Grafana
Visualisation & Analytics:	Tableau, Custom Dashboards (React/HTML)
CI/CD:	Git, Bitbucket, Jira, Ansible, GitHub Actions

Professional Experience

Bank of America – Data Engineer

Jul 2022 – Present

Greenfield Internal Data Platform

- Sole engineer responsible for architecting, building and operating a greenfield full-stack internal platform end-to-end (backend, frontend, database and deployment).
- Built a Django-based system with custom JS/Tailwind frontend, deployed on the bank's cloud via Apache httpd.
- Implemented Kafka messaging to support asynchronous reporting, notifications and pipeline monitoring, improving reliability and scalability.
- Adopted by 300+ security and infrastructure users, with 50+ actively planning and tracking patch operations.
- Replaced spreadsheets and MS Access databases with a single production-grade application, eliminating manual processes and improving data accuracy.
- Owned the full lifecycle from requirements gathering through production support.

Data Pipeline Modernisation

- Migrated legacy SSIS/SQL jobs to modular Python ETL pipelines with automated validation and centralised logging.
- Refactored stored procedures into DBT models, improving traceability, testing and maintainability.
- Led migration from single-node development to clustered production architecture.

Reporting & Stakeholder Delivery

- Designed and maintained 20+ Tableau dashboards supporting enterprise vulnerability and risk reporting.
- Built SQL models and views providing consistent, trusted datasets.

Stakeholder Collaboration

- Worked directly with Business Analysts and technical stakeholders to translate requirements into data products and deliver via CI/CD.

Tesco - Customer Assistant and Shift Leader

Apr 2020 – Jun 2022
Worked part-time while studying; promoted to shift leader, demonstrating leadership and reliability.

Technical Projects

Option Trade Analysis Platform – Personal project building a high-performance market data platform with real-time streaming and historical analytics.

- **Streaming ingestion:** Implemented Kafka pipelines ingesting real-time U.S. equity/option trades, transforming and storing into an Iceberg S3 data lake.
- **Batch processing:** Scheduled daily historical pulls and aggregations with Airflow, maintaining bronze/silver/gold datasets in S3.
- **Analytics layer:** Loaded curated data into ClickHouse for fast OLAP-style queries and sub-second analytical workloads.
- **API & frontend:** Built a FastAPI backend and React (Vite) dashboard for interactive visualisation and screening.
- **Deployment:** Containerised services and deployed to AWS ECS (Fargate) with Terraform, plus monitoring via Prometheus/Grafana.
- **Performance:** Optimised schemas and partitioning to support millions of rows/day and sub-second analytical queries.

Other Projects – I have worked on several other projects at in my own time including a smart home device scheduling automation tool and my personal website. Each of these projects, I make use of Claude AI models as well as CI/CD pipelines in GitHub.

Education

University of Leicester - MPhys Physics with Space Science

Sep 2018 – Jun 2022

Grade: First class

Key modules: Statistical Physics, Statistical Data Inference, Computational Physics, Core Physics, Experimental Physics. Optional courses and end-of-year projects focused heavily on computational physics, including applying machine-learning algorithms to physical data sets.

Selected year-end projects

- **Predicting star classification using Gaussian Processes** – Modelled time-series data with Python and R, applying Gaussian processes and Fourier transforms to develop predictive scientific models on the classification of stars.
- **Dynamics of Circumbinary Planets** – Simulated three-body orbital dynamics on a supercomputer using C and batch processing to identify stable orbits.

King Edward VI Sixth Form College

Sep 2016 – Aug 2018

3 A-Levels (A* A A) in Maths, Physics, and Computer Science
